Solutions specialist

Used individually or in combination, our technologies solve a wide range of challenges across the entire construction sector – from industrial, commercial and housing projects to infrastructure construction.

Global strength and local focus

Global strength and local focus are what makes us unique. Our knowledge of local markets and ground conditions means we're ideally placed to understand and respond to a particular local engineering challenge. Our global knowledge base then allows us to tap into a wealth of experience, and the best minds in the industry, to find the optimum solution. With 10,000 employees and operations in more than 40 countries, we have the people, expertise, experience and financial stability to respond quickly, get the job done and see it through safely.

By connecting global resources and local knowledge, we can tackle some of the largest and most demanding projects around the world but the everyday work we do is just as important and, in total, we handle an unrivalled 7,000 projects every year.

Overview

The unique character of each project and the underlying site conditions mean that customised solutions in the planning and construction of excavation support are essential. As a full-service provider, Keller is able to offer solutions perfectly tailored to the requirements of any project.

Keller can provide suitable solutions for many soil conditions and technical requirements in connection with excavation support. Our extensive geotechnical expertise accumulated over the years enables us to provide cost-efficient solutions, especially on complex shoring systems.

The variety of systems we are able to offer allows us to respond flexibly to a variety of boundary conditions. We are committed to maintaining the highest quality and environmental standards, which are deeply rooted in our company philosophy.

Our engineers are constantly pushing the boundaries of our high-performance products, and we make extensive use of the most advanced software to ensure our designs are the best they can be to suit your project.

Health and safety

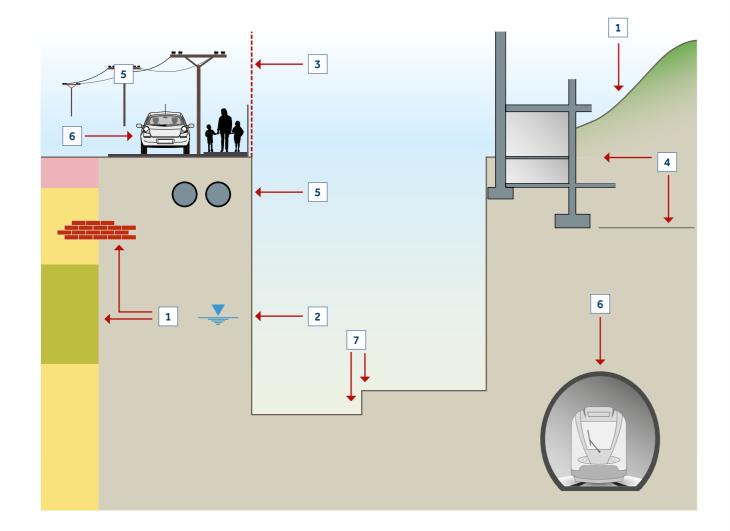

Health and safety is a priority for Keller and we have a proven track record of one of the lowest accident frequency rates in our industry. The commitment of leaders and employees to our Think Safe programme has earned us awards and recognition from industry bodies as well as our clients.

We believe no one should be harmed as a result of any work we do and our ultimate goal is zero incidents.

When designing and constructing excavation support, we work to complex boundary conditions and performance requirements, whilst considering how to make the best use of the land available.

Requirements

- Minimum impact on existing building structures
- No disturbance to day-to-day operations
- Optimum use of plot space and facilitie
- Integration of foundation system into the overall structure
- Minimum deflection even for deep excavation support
- Compliance with environmental standards, noise dust- and vibration regulations
- Efficient use of natural resources
- Extensive monitoring and verification through measurement, with detailed records
- Close cooperation between owner, designer and foundation specialist

1. Soil conditions
 Difficult soil conditions
 (stratigraphy,
 obstructions, existing
 slopes etc) require careful
 design and planning to
 select an appropriate
 solution.

2. Groundwater

Protection of groundwater against pollution and prevention of water ingress into the excavation pits.

3. Plot boundaries

Plots and existing rights of way require particular care when planning the building site and during construction.

4. Existing buildingsDamage to adjacent

Damage to adjacent buildings as a result of the work being conducted must be avoided. In particular, the serviceability of the existing building foundations must not be compromised. This often requires additional support and underpinning to secure them.

5. Underground services
Underground services
such as sewage and water
pipes, power lines and
communication cables
must remain in service,
especially in densely
populated areas such as
city centres.

6. Traffic

Traffic flow should be impeded as little as possible and existing traffic infrastructure needs to be protected against damage.

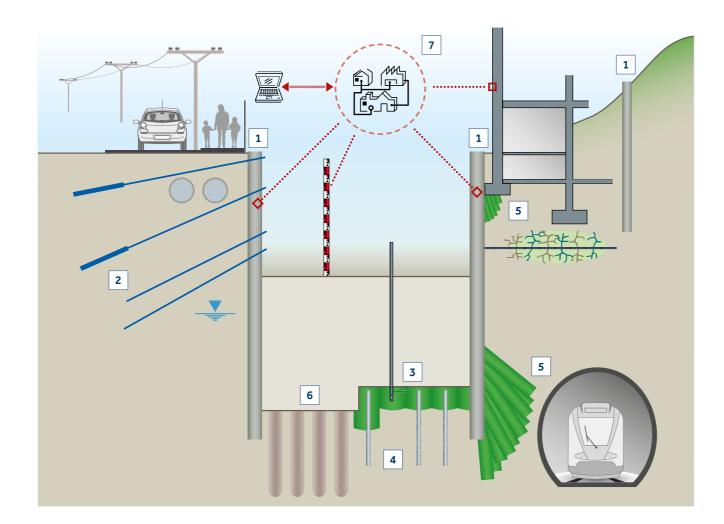

7. Varying excavation depths

Some projects require excavation depths to vary across the site, for which a range of tailored solutions may be required.

Keller offers flexible solutions and specialist techniques to solve even highly complex excavation support problems. Working to industry leading quality and environmental standards is an integral part of our philosophy.

Solutions

- Flexible response to unexpected problems

- Bored pile walls
- Diaphragm walls
- Sheet pile walls
- Berlin type pit lining
- Shotcrete
- Soil mixing method (DSM)
- Jet grouting method (including Soilcrete® wall/ underpinning)
- Combined solutions (eg bored piles and Soilcrete®)

2. Groundwater

- Anchors
- Soil nails
- Steel and concrete reinforcements

3. Base slabs

- Jet grouting method (Soilcrete®)
- Soft-gel chemical grout
- Underwater concrete

4. Uplift control

Micropiles

page 10

Discovery Basement Sandton, Johannesburg, South Africa

Keller company Franki Africa carried out a mammoth 550,000m³ excavation and 15,540m² lateral support basement for Discovery's new head office.

Geotechnical investigations of the site revealed a very complex diabase dyke along most of one of the boundaries and a deeper weathering of the granite bedrock in the area surrounding the intrusion. This resulted in the provision of additional anchor force, and reduction in the rock excavation and blasting requirements. The biggest challenge was the doubling of the anchor forces required to provide satisfactory stability to the excavation face, and limiting the movements of the sites surrounding the excavated area.

Project examples

The Yacht Club Cape Peninsula, South Africa

The Yacht Club development is a prestigious multi-use commercial and residential space on the Malmesbury group deposition of the Cape Peninsula in Cape Town's Foreshore.

Ground conditions on the site included shale bedrock overlain by very stiff residual material followed by marine deposits and fill made up of old harbour facilities, rubble and dredged sands.

An existing sub-surface canal running south to north and intersecting the eastern portion of the site required special attention. Keller expertise was utilised to design a modified lateral support and piled foundation solution to accommodate and maintain the integrity of the structure.

On this multi-storey, double-basement project, Keller company Franki Africa designed and installed 271 foundation piles, lateral support at 508lm as well as the disposal of 65,000m³ bulk earthworks.

page 12 page 13

Neuer Kanzlerplatz Bonn, Germany

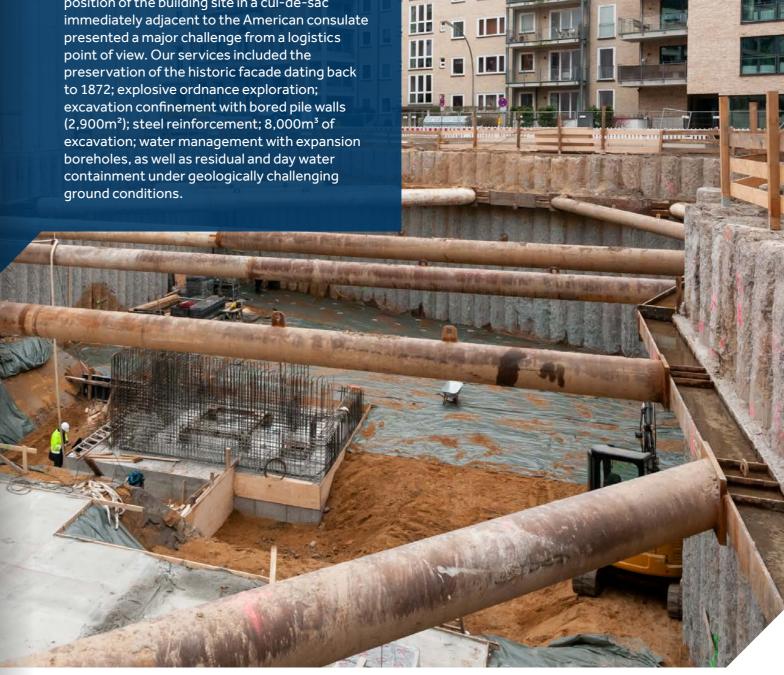

Located in the heart of Bonn, the 'Neue Kanzlerplatz' is an attractive urban quarter consisting of modern office buildings and a hotel. The project comprised three pentagonal buildings including a 100m-tall high-rise structure and a three-storey underground car park.

excavation pit covering an area of 20,000m², with a depth of up to 12m. Our services included 6,000m² of diaphragm walls; 2,000m² of secant bored pile walls; 7,000m of anchors; steel reinforcements and 130,000m3 of excavated material.

Project examples

Warburgstraße Hamburg, Germany

In a high-class residential area in Hamburg, Keller Grundbau constructed a complete excavation pit for a new eight-storey residential building with three underground floors. The position of the building site in a cul-de-sac immediately adjacent to the American consulate presented a major challenge from a logistics point of view. Our services included the preservation of the historic facade dating back to 1872; explosive ordnance exploration; excavation confinement with bored pile walls (2,900m²); steel reinforcement; 8,000m³ of excavation; water management with expansion boreholes, as well as residual and day water containment under geologically challenging

Keller Grundbau constructed the complete

Basement of Old Mutual building Sandton, Johannesburg, South Africa

Project

examples

Keller company Franki Africa completed work on the basement for the Old Mutual building; a project which faced many challenges, including the extensive diabase dyke, the presence of the Gautrain tunnel (running directly under the site) and the integration of an adjoining development.

The Gautrain necessitated a challenging approach for the excavation and 'expected' rock profile works directly over its tunnel alignment along the entire Rivonia Road face. No blasting was permitted in this region. The soldier piles had to be installed deeper than the final excavation level over this area.

The design comprised 184 soldier piles at 600mm Ø drilled to refusal, 12,500m² of gunite walls, 860 strand anchors of 600kN and 750kN capacity and 920 soil nails/rock-bolts varying in length from 3m to 12m. The total excavation volume was calculated to be 380,000m³, of which 80,000m³ was in hard rock.

Shopping centre, Tamaraceite Canary Islands, Spain

Keller Cimentaciones was awarded excavation and retaining structure design and construction work for a large shopping centre. The cohesionless soil and close proximity of a road, meant that a 180m-long pile wall braced with ground anchors was required.

page 16 page 17

Frankfurt, Germany

The 'Hafenparkquartier' project is under development in Frankfurt within close vicinity of the river Main, besides the European Central Bank.

Keller Grundbau was awarded the contract to construct the 10m-deep excavation pit on an area of 15,000m² – including related earthworks and dewatering system. The scope of works comprises the construction of an 18m-deep secant bored pile wall with two rows of retaining anchors. In part of the area, permanent micropiles are installed to prevent flotation. Foundation piles with a diameter of 1.5m will be constructed beneath the high-rise buildings.

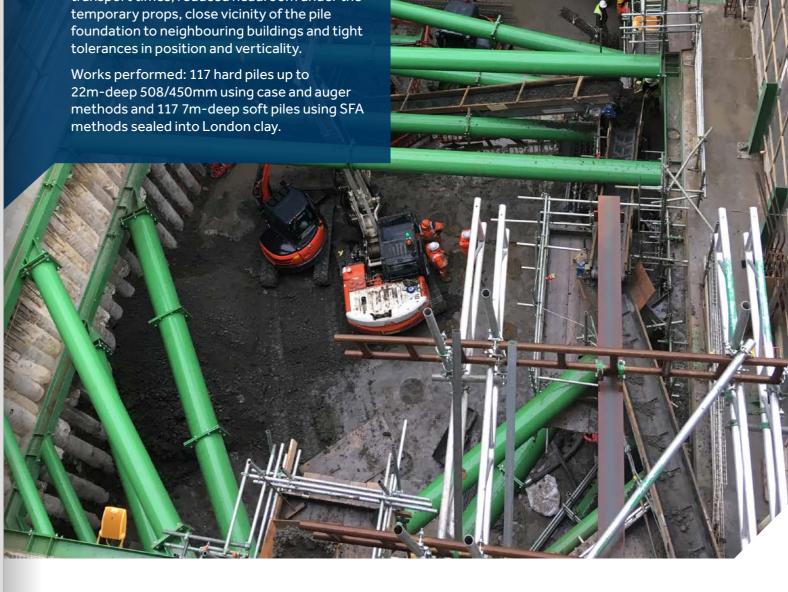

Project examples

141 Harley Street London, United Kingdom

Design and construction of restricted access mini piles to form a 73 linear metre secant pile wall, a 35 linear metre contiguous pile wall and load bearing piles in low headroom conditions to allow the excavation of a three-storey basement in central London to accommodate a new proton beam therapy facility.

Amongst the challenges overcome by Keller UK were strict noise restrictions, materials transport times, reduced headroom under the temporary props, close vicinity of the pile

Project examples

LKH – Universitätsklinikum Graz, Austria

Keller Grundbau's scope of work for this prestigious project in the Steiermark state of Austria was divided into two phases:

KOSTMANN

KOSTMANN

四 祖 祖

The slope protection for the emergency access constructed with a continuous flight auger (CFA) pile wall (630mm diameter/8m average length) using 20cm-thick shotcrete infill.

And the 25m-deep excavation pit support executed in two sequences via a lower and upper pile wall. The upper wall installed two-three metres from the lower, using the same piling method as for the emergency access works but with CFA piles up to 20m deep.

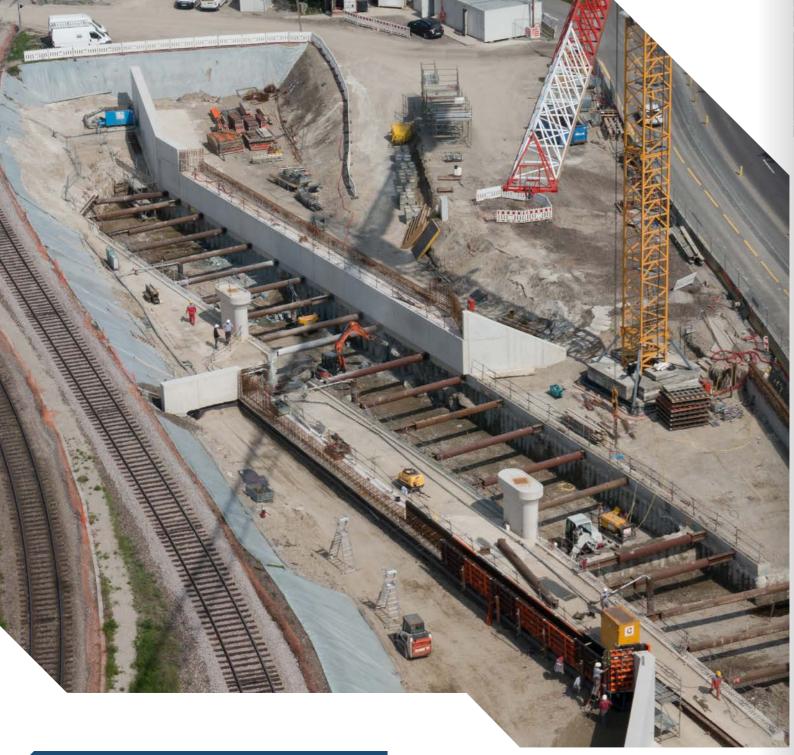

Muharraq Sewage Treatment Plant (STP), Bahrain

The Muharraq STP involved the construction of gravity sewer and network connections comprising 47 shafts, one intermediate lifting station (ILS) and one terminal lifting station (TLS). Keller's scope includedeight shafts and one ILS varying in diameter and depths. Keller constructed 0.9m diameter secant piles to a maximum depth of 22.5m to allow the deep shaft excavation works to proceed in dry conditions. Double walled steel casings were used to case the entire length of the secant piles ensuring the required verticality that subsequently produced adequate secant between adjacent piles that is essential to prevent water seepage.

page 20

page 22

Trémie du Port Autonome de Strasbourg, France

The extension of the Strasbourg tramway line D needed to pass under an existing railway line, so an underground passage was constructed below the groundwater table.

Keller Fondations Spéciales installed 620mmdiameter secant piles and a 1,200m2 injected slab (1,000mm thick, cement grout and silica mix) as temporary cut-off during civil works.

Project examples

page 24 page 25

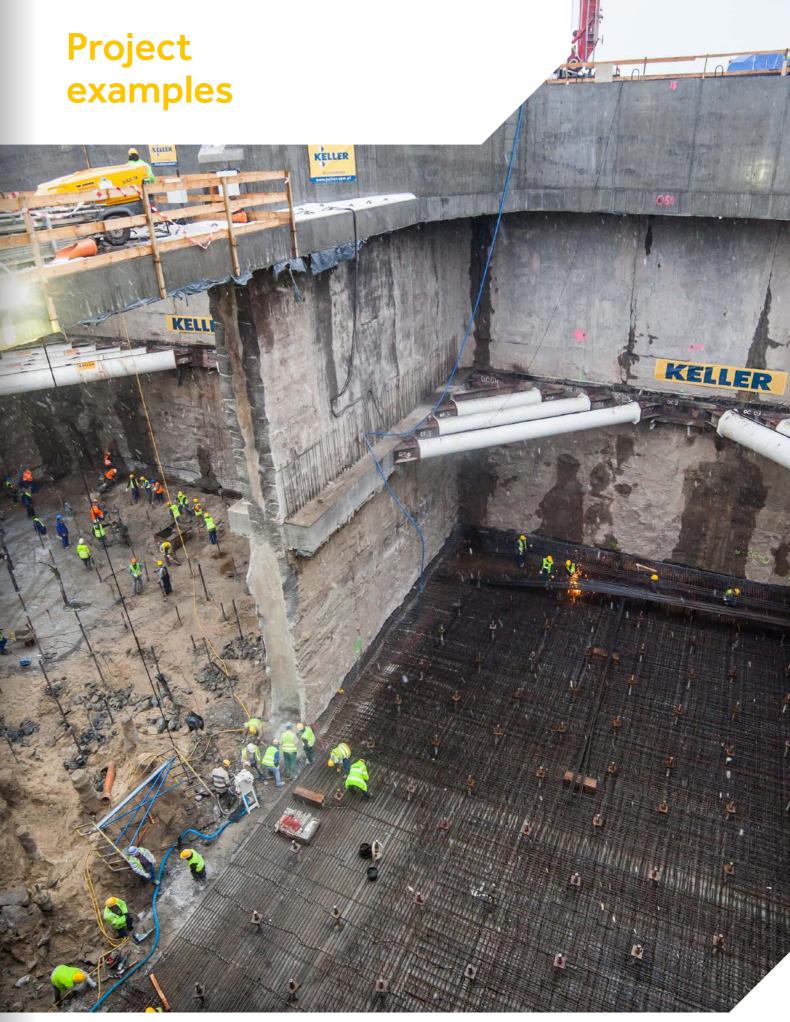

The project involved construction of of (up to) 22m-deep and 1,090m-long excavation pits for tunnel ramps and two Tunnel Boring Machines chambers. The team worked with high groundwater levels and challenging ground conditions at the Vistula River estuary, characterised by an alternating presence of sands and soft organic silt. The client adopted Keller's design proposal to move from working underwater to a dry operation to cut construction time and reduce costs. Anchored soilcrete plugs were used in TBM chambers to ensure structural stability and water-tightness - a unique approach.

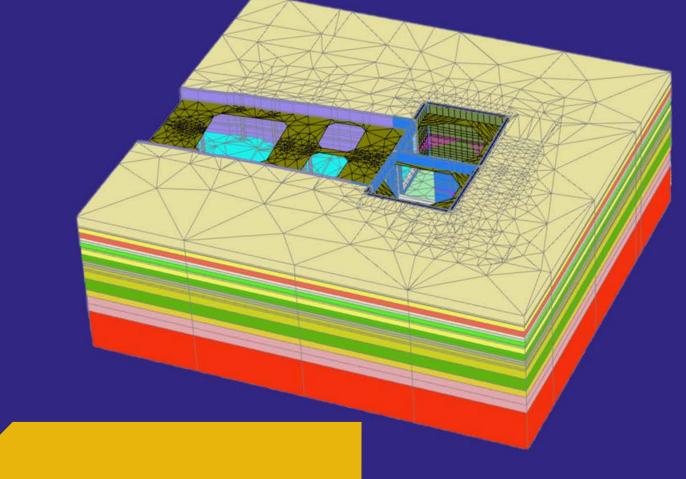

The scope of work included 66,400m² d-walls, 42,000m³ jet grouting, 60,000m micropiles, 1,500m³ reinforced concrete, and the installation of 3,000 tons steel structures.
